

Redline Smart Order Routing Solution

Dramatically increase your performance while reducing your operational expenses

Order routing decisions based on current market conditions require low-latency views of many markets simultaneously. Most solutions today use CTA/UTP and OPRA as their source for market data. However, these feeds are not the lowest latency view into the markets. Furthermore, these deployments typically incur costs associated with deploying a large number of servers to handle market data bursts so as not to fall behind. Using direct exchange feeds greatly lowers the latency of the source market data but makes the processing challenge even greater. With most of these solutions, order routing decisions are made with stale data, and the deployment results in increased operational expenses.

Redline Trading Solutions solves this problem by allowing both direct exchange feeds and consolidated feeds to be combined in a single-server solution with the market's lowest latencies. The Redline InRush™ Accelerated Ticker Plant provides an offload engine that accelerates the book processing for every symbol on every exchange while freeing the computational resources of the server for your application. You are now able to run your liquidity-seeking strategies on a single server with full access to the lowest latency view of the markets. Operational expenses are dramatically lowered as tens of servers are merged into a single server. Revenue generation increases as you're able to route orders to the best prices across the markets.

InRush's ability to process market data bursts results in the fastest, most deterministic solution on the market. The flexible InRush API provides a consolidated view of current market conditions, allowing you to maintain compliance while executing on the most relevant information.

- Customized, aggregated views of market liquidity
- Venue prioritization
- Subscription filtering

Redline's InRush Accelerated Ticker Plant provides you with a view of the markets that will allow you to Lead with Speed.

LEAD WITH SPEED

PERFORMANCE

Make order routing decisions on market data processed in as little as 1.5 microseconds

SCALABILITY

Capacity to consolidate U.S. equities or options market views in a single server

FLEXIBILITY

Normalized API supports local and distributed views
